- 1. Lung function and patient symptoms are key factors in determining whether clinical remission can be achieved. It's important to closely monitor the patient.**
- 2. If the patient's lung function and symptoms remain unstable, it may be advisable to consider stepping up to Trelegy 200, from the perspective of achieving clinical remission.**
- 3. Biologics with anti-IL5 for SEA can achieved clinical remission in one-third patients for at least 2 years.**
- 4. Early escalation to triple therapy or biologics will also have a higher likelihood of achieving clinical remission in the future.**
